SHOW VLAN BRIEF:-

The show vlans command lists the VLANs currently running in the switch, with VLAN name and VLAN status. Dynamic VLANs appear only if the switch is running with GVRP enabled and one or more ports has dynamically joined an advertised VLAN. We use the show vlan command to verify over VLAN configuration. This command displays all switchports and their associated VLAN as well as the VLAN status and some extra parameters that relate to Token Ring and FDDI trunks. We can also use the show vlan id [vlan#] command to see information about a particular VLAN.
